

System Integration

SafeEx provides REST APIs to connect other systems that are integral to the efficiency of your operations, helping you automate processes, reduce developing time and mitigate the possibilities of errors.

ADVANTAGES OF INTEGRATION

EFFICIENCY

REST API integrations enable multiple systems to communicate flexibly with each other, allowing you to utilise the respective functions of each system without compromises.

AUTOMATION

Any updates and changes made in one system will be communicated and automatically implemented throughout the integrated system workflows.

SECURITY

REST API conform to specific requirements, ensuring that only authorised persons can access certain data. As a standard, we run a series of tests in the programming interface and integration to analyse the credibility and security.

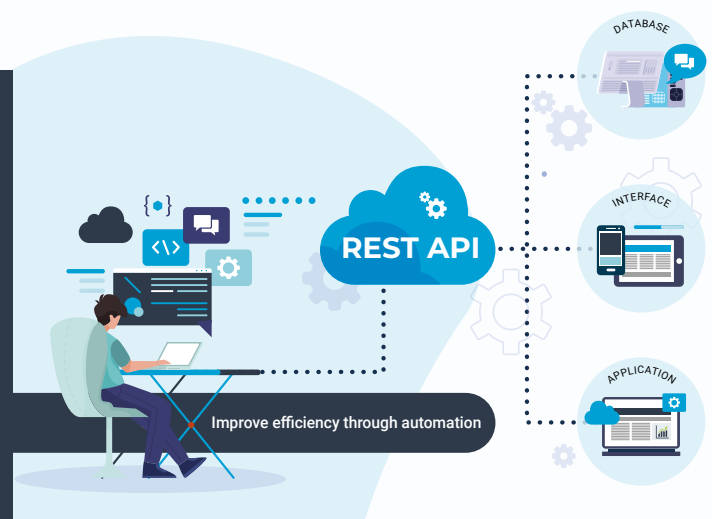

Integrating your systems with SafeEx Cloud enables you to automate your business processes; embed and share data between multiple applications and software. You can ensure consistency throughout your data flow by allowing your digital systems to communicate with each other and automating updates.

HOW DOES IT WORK?

An update made on System A, which could be a deletion of an item, an information change, or a creation of an item, will be communicated and implemented to system B and other integrated systems.

SIMPLIFIED PROCESS WITH REST API

REST (Representational State Transfer) API allows interaction between applications and software, removing the gap between digital systems. Using our REST APIs, you can be assured that security, control and access authentication are maintained throughout your systems. With REST API, the server and client are separated, allowing more flexibility, and making it a faster method for integration than other defined protocols.
