

Data Migration

The data migration process must succeed right from the start. Any mistake during the process can be costly, resulting in delayed projects, inaccurate data or pricey additional procedures.

Undertaking a data migration project requires your full attention, rather than making it subordinate to another project. **We offer 3 types of data migration solutions** to suit your current objectives and situation.

FAST • SAFE • ACCURATE

Do it yourself

Migrate your data into the SafeEx Cloud system by yourself. We only recommend this solution to companies that already have a qualified team designated to focus on handling the migration project.

With our assistance

Save your time spent on the project and ensure a seamless process. Migrate your data with the help of our skilled team. Get recommendations and access to additional development services that guarantee an accurate and secure data transfer.

Leave it to us

Get a system ready for operation so you can focus on your other priorities. Send us everything in any format; we will take care of everything. We highly recommend this solution if you have a more extensive data register.

SAFETY AND ACCURACY

Risks are always involved when you move data from one system to another. It may be data corruption or leakage.

At SafeEx, we prioritise security in all aspects of our processes to block threats using APIs, secure file sharing channels, and comprehensive testing.

THE MIGRATION PROCESS

Data preparation

Know the scope of the data you extract for import. Clean your data for duplicates and typing errors.

Implementation

Depending on the data source, the implementation process can be done out of the box or automated through APIs using scripts.

Testing and adjustments

Tests and adjustments will be conducted until the success of the implementation phase is determined.

Ready for operation

After determining that the process is a success, the system is ready for operation and proceeds to the onboarding phase.
